Patent Infringement Lawsuit Filed Against Shanghai AWA Electronic Equipment Joint Stock Company

Nidec Corporation (the "Company") today announced that it has instituted a lawsuit against Shanghai AWA Electronic Equipment Joint Stock Company ("Shanghai AWA") at Shanghai Intellectual Property Court for infringement of the Company's Chinese Patent ZL02118511.5 relating to mobile phone vibration motor technology.

<The Company's intention regarding the lawsuit>

In this lawsuit, the Company seeks injunctive relief to legally stop the sale, etc. of patent-infringing products by Shanghai AWA.

The Company, which values its intellectual properties as very important management resources, intends to continue to act resolutely when it determines that any of its intellectual property rights has been infringed.

<Background information regarding the lawsuit>

In September 2015, Nidec Corporation and Nidec Seimitsu Corporation (collectively, the "Companies"), one of the Company's subsidiaries, submitted a letter of warning to Shanghai AWA to stop its infringement of the Companies' multiple patent rights relating to mobile phone vibration motor technology. However, Shanghai AWA refused to settle the issue amicably, leading Nidec Seimitsu Corporation to institute an infringement lawsuit regarding Chinese Patent ZL200910003612.5 at Shanghai Intellectual Property Court in November 2015, while the Company instituted an infringement lawsuit over Chinese Patent ZL01103328.2 at the same court in December 2015.

While the Companies were waiting for the opening of their respective trials at Shanghai Intellectual Property Court, Sichuan Awa Precision Electric Electrical Appliance Co., Ltd. instituted an invalidation trial over Chinese Patent ZL200910003612.5 held by Nidec Seimitsu Corporation in January 2016, and another invalidation trial against the Company's Chinese Patent ZL01103328.2 in April 2016, respectively.

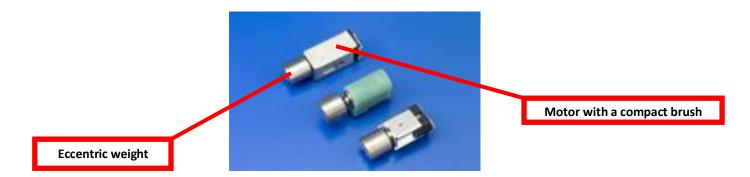

Regarding our Chinese Patent ZL01103328.2, a trial judgment affirming the validness of the patent right has already been delivered by Patent Reexamination Board of Patent Office of the People's Republic of China.

Consequently, the Company, convinced that solving these aforementioned cases by negotiation would not be a practical option, inevitably determined to bring an additional lawsuit against Shanghai AWA at the court to protect the Company's intellectual properties against infringement.

<The mobile phone vibration motor technology owned by the Companies>

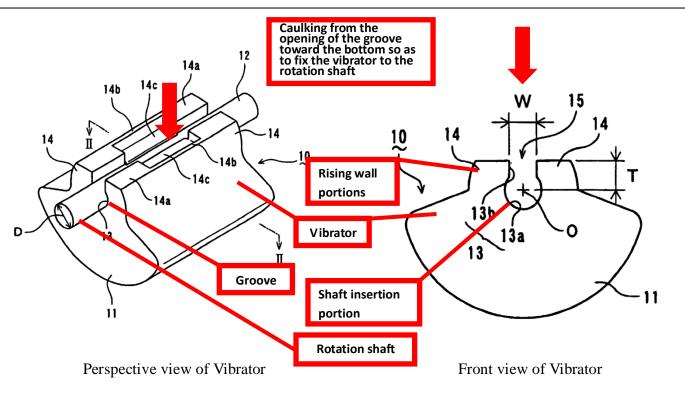

A mobile phone vibration motor is a compact brush motor equipped with an eccentric weight and installed inside a mobile phone, etc. The motor vibrates as it rotates, informing a mobile phone user of an incoming call without the use of a ringtone.

<Explanation of technology of Chinese Patent ZL02118511.5 of the new lawsuit filed recently>

The vibrator of this patent is a vibrator for a vibration generation apparatus of compact radio equipment. It is made of ultra heavy metal molded of a powder material whose principal ingredient is tungsten. It is integrally coupled by caulking to the motor rotation shaft of the vibration generation apparatus of compact radio equipment. A groove through which the rotation shaft is to be inserted is formed in a contour part of an eccentric load portion. The groove includes a shaft insertion portion extending in a range of a center angle 180° of the rotation shaft or greater and further includes rising wall portions that are formed between the shaft insertion portion and the opening of the groove and face each other as opposite wall portions with a gap therebetween, the middle of which is narrower than the outer diameter size of the rotation shaft. The two sides of the groove are caulked from the opening of the groove toward the bottom, thereby being fixed to the rotation shaft.

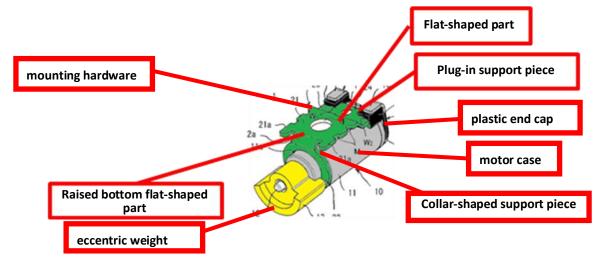

<For your information>

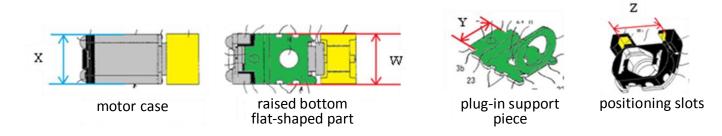

Explanation of technology of Chinese Patent ZL200910003612.5 of the lawsuit filed in November 2015

The vibration motor of this patent includes a vibration motor body attaching an eccentric weight to a motor shaft sticking out from a projection at one end side of a motor case and attaching a pair of motor terminals to a plastic end cap closing an opening of said motor case at the side opposite to the projection and further includes mounting hardware carrying this vibration motor body and to be set on a board.

The mounting hardware has a raised bottom flat-shaped part facing a barrel circumference of the motor case, oriented in an axial direction, and to be bonded to mounting patterns on the board, a collar-shaped support piece extending from this raised bottom flat-shaped part and fit over the projection in the axial direction, and a plug-in support piece extending from the raised bottom flat-shaped part to the side opposite to the projection and plugged into positioning slots provided in the plastic end cap in the axial direction.

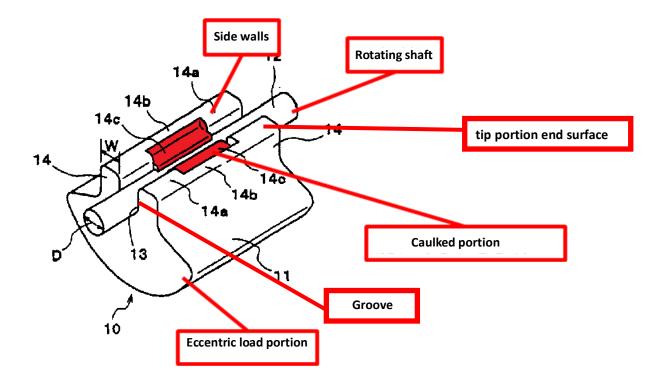

X (Thickness of Motor Case) \ge W (Width of Weight), Y (Width of Plug-in Support Piece), Z (Width of Positioning Slots)

Explanation of technology of Chinese Patent ZL01103328.2 of the lawsuit filed in December 2015

This patent relates to a vibration generation apparatus of compact radio equipment with a vibrator integrally coupled to a rotating shaft of a motor, comprising: an eccentric load portion, a groove portion, for securing therein the rotating shaft, in the eccentric load portion, side walls bulging in parallel from the eccentric load portion and forming both side edge portions of the groove portion, wherein a portion of a tip portion end surface of the side wall except an outer peripheral portion of the side wall and at a side of the groove portion is caulked from an opening side of the groove portion to a bottom side, so that the vibrator is integrally coupled to the rotating shaft.

<Intellectual Property Rights>

The lists below show a portfolio of intellectual property rights held by Nidec Corporation and a portfolio of intellectual property rights held by Nidec Seimitsu Corporation regarding the motor cover of a vibration motor for a mobile phone and regarding an eccentric weight.
